Plataforma de autenticación y autorización adaptable

# Open Authorization

 Open Authorization es un estándar abierto que permite flujos simples de autorización para sitios web o aplicaciones informáticas. Se trata de un protocolo propuesto por Blaine Cook y Chris Messina, que permite autorización segura de una API de modo estándar y simple para aplicaciones de escritorio, móviles y web.

- OAuth permite a un usuario del sitio A (proveedor de servicio) compartir su información con el sitio B (llamado consumidor) sin compartir toda su identidad.
- Para desarrolladores de consumidores, OAuth es un método de interactuar con datos protegidos y publicarlos. Para desarrolladores de proveedores de servicio, OAuth proporciona a los usuarios un acceso a sus datos al mismo tiempo que protege las credenciales de su cuenta.

 Este mecanismo es utilizado por compañías como Google, Facebook, Microsoft, Twitter y Github para permitir a los usuarios compartir información sobre sus cuentas con aplicaciones de terceros o sitios web

#### **Abstract Flow**

#### Role

Will you be responsible for coding the implementation of Auth0?

#### ☐ Chat with an expert

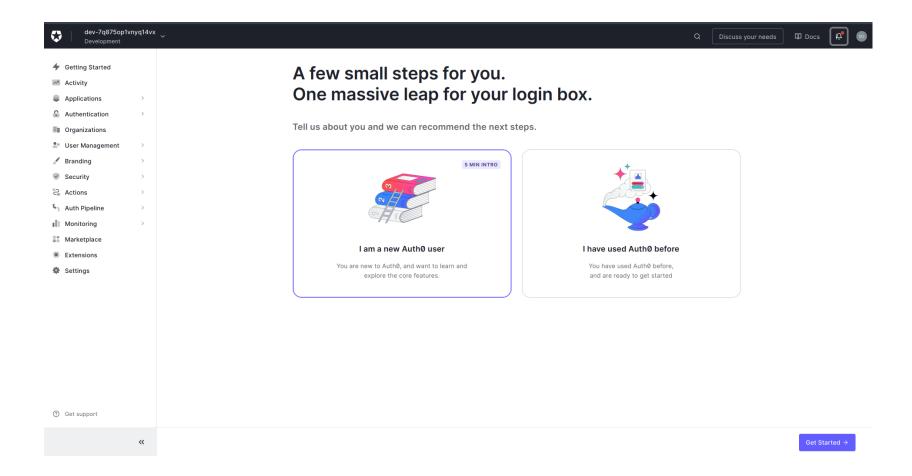

I'd like to schedule a 1:1 to discuss AuthO's features and capabilities, and learn more about offerings and pricing plans.

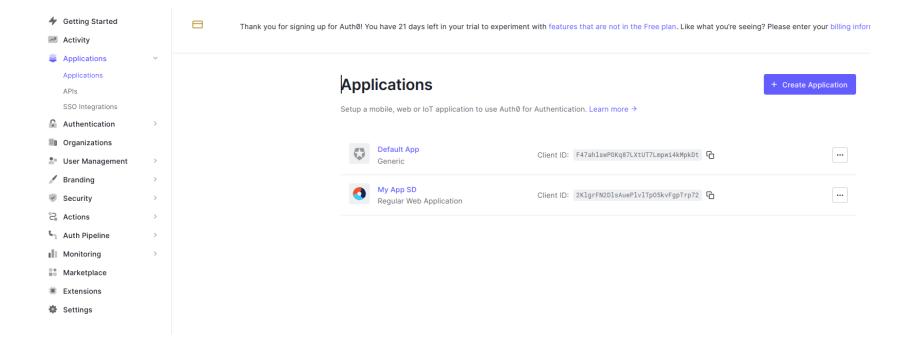

#### ■ I need advanced settings ①

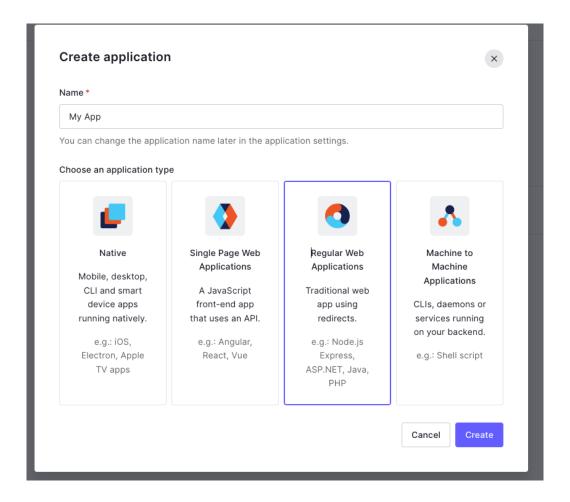

We've assigned your data region to the United States and given you a tenant name. Check this box If you need to process your data in a different region to comply with privacy laws.

By submitting, I agree to the processing and international transfer of my personal data by Auth0 (a product unit within Okta) as described in the Privacy Policy.

REGULAR WEB APP

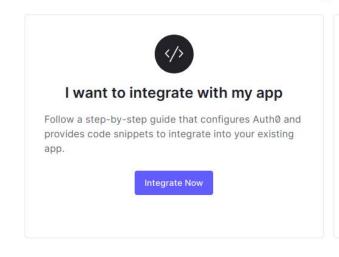

#### What technology are you using for your project?

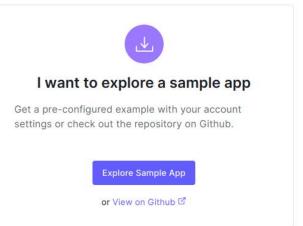

REGULAR WEB APP / EXPRESS

#### Choose your path

#### Node.js (Express)

#### Configure Auth0

To communicate with Auth0 services you need to set up allowed URLs for specific actions on your Auth0 application. We've provided defaults so you can test in on your local environment but you can change them to match your setup.

#### Allowed Callback URL

A URL in your application where Auth0 redirects the user after they have authenticated.

http://localhost:3000/callback

Specify multiple valid URLs by comma-separating them. Make sure to specify the protocol https://, otherwise the callback may fail in some cases. With the exception of custom URI schemes for native clients, all callbacks should use protocol https://.

#### Allowed Logout URLs

A URL in your application that Auth0 can return to after the user has been logged out of the authorization server. This is specified in the returnTo query parameter.

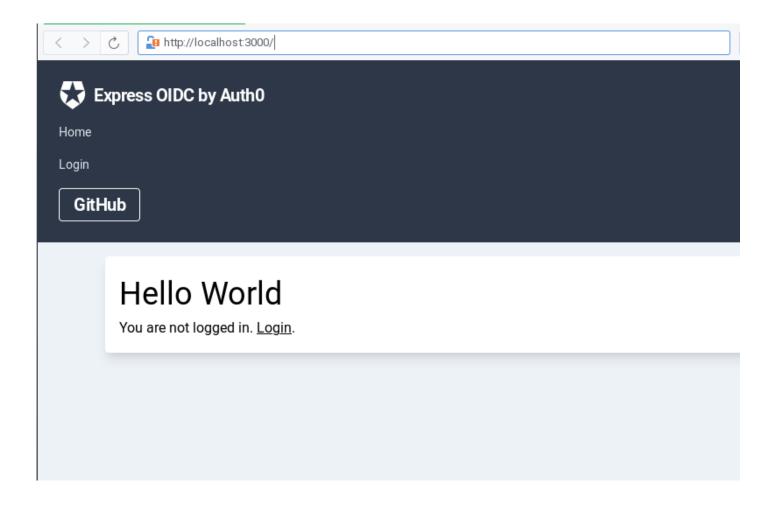

http://localhost:3000

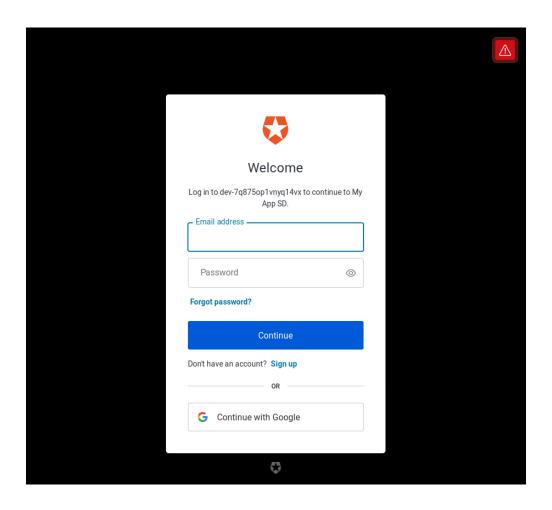

Specify multiple valid URLs by comma-separating them. Query strings and hash information are not taken into account when validating these URLs. Learn more

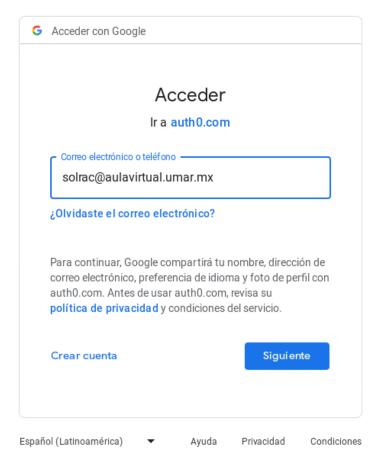

Save And Download App

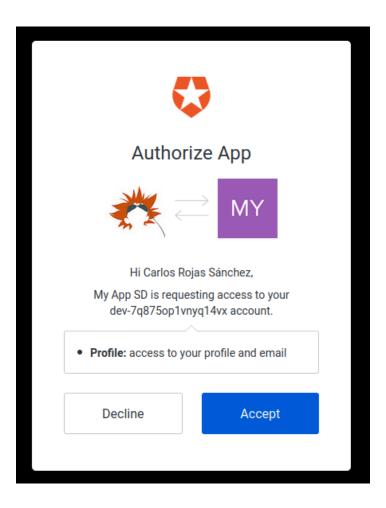

```
[ \lambda 01-login ] npm start
> start
> node server.js

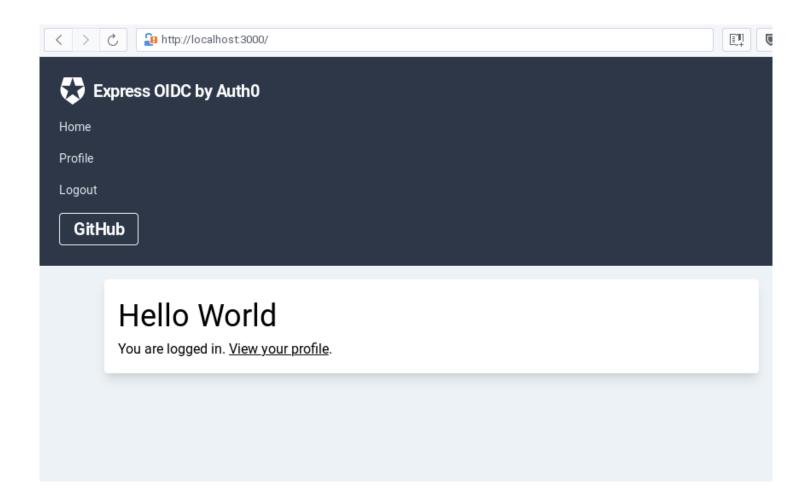

Using 'form_post' for response_mode may cause issues for you logging in over http, see https://github.com/auth0/express-openid-connect/blob/master/FAQ.md
Listening on http://localhost:3000
```

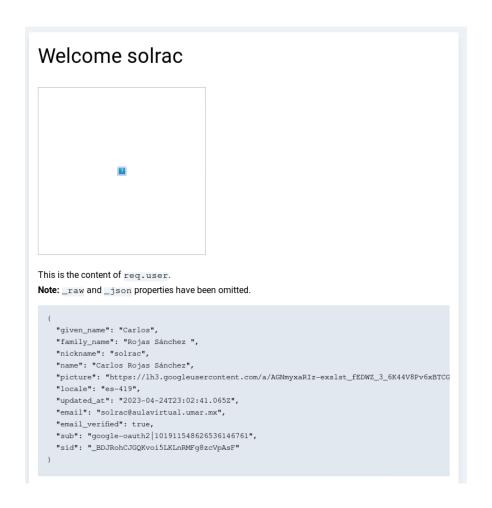

```
> start
> node server.js

Using 'form_post' for response_mode may cause issues for you logging in over http, see https://github.com/auth0/express-
openid-connect/blob/master/FAQ.md
Listening on http://localhost:3000
